

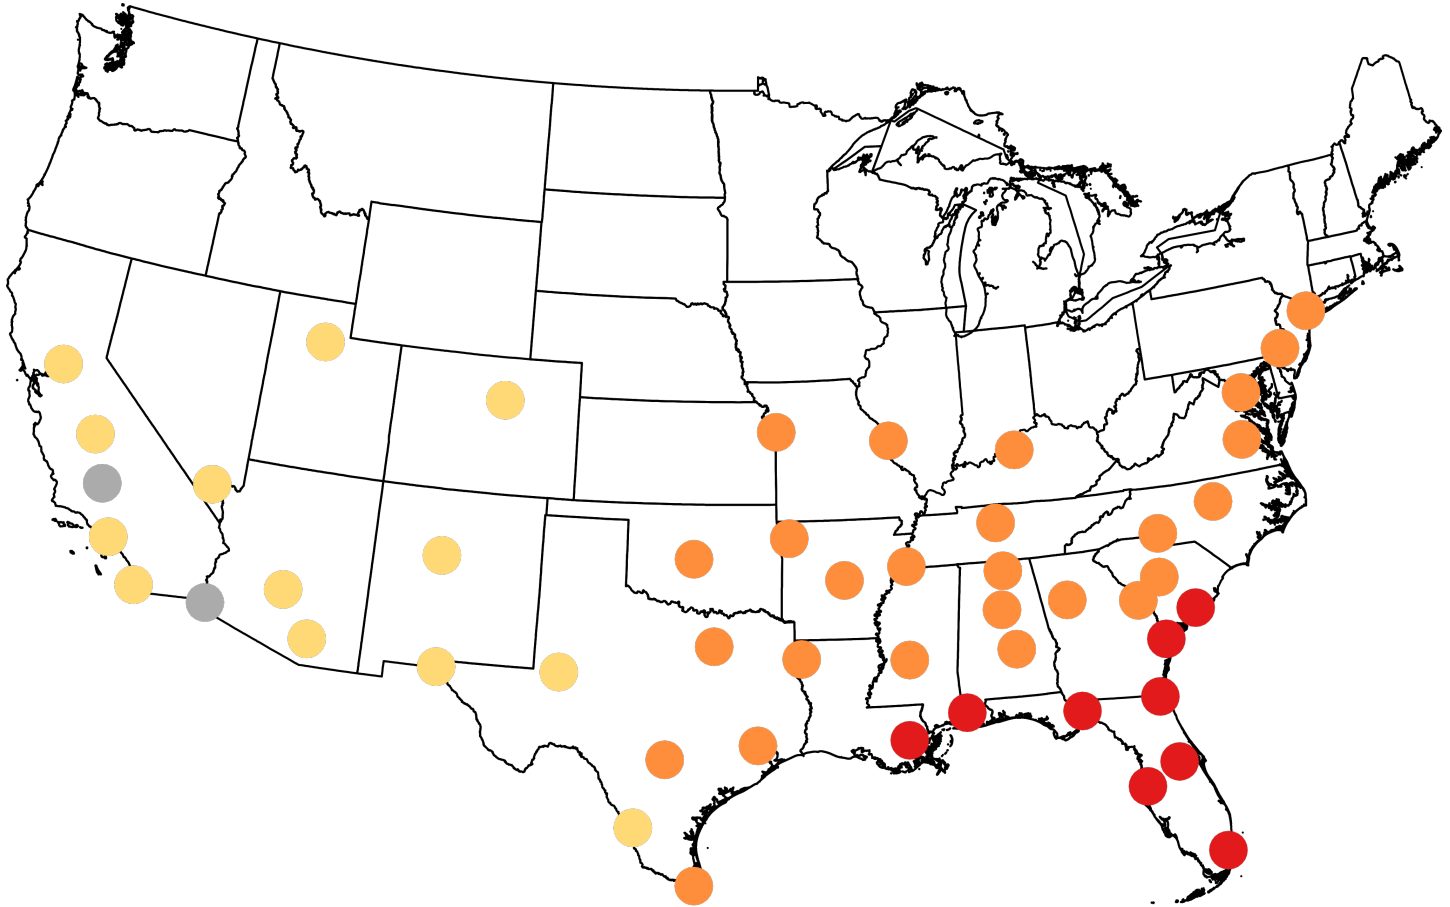

Figure 19.6 Potential Abundance of Disease-Carrying Mosquito

Ae. aegypti potential abundance

- High
- Moderate to high
- Low to moderate
- None to low

Figure 19.6: The map shows current suitability for the *Aedes aegypti* mosquito in July in 50 different cities. *Aedes aegypti* mosquitoes can spread several important diseases, including dengue fever, chikungunya, and Zika fever. The Southeast is the region of the country with the greatest potential mosquito activity. Warming temperatures have the potential to expand mosquito habitat and disease risk.
